

EAGLE

world~wide dependability

Introduction

Eagle of Warwick is one of the world's leading specialist vehicle manufacturers. Over 70 years' experience in the design and development of all types of vehicle bodywork to meet special applications has ensured the

Company a reputation of high quality engineering which is reflected in the durability, operational efficiency and reduced maintenance costs of its products.

The Eagle product range includes vehicles used the world over in Municipal, Communications, Aviation and Fire Fighting operations; all fields in which the Company has accumulated considerable experience and engineering expertise.

Refuse Collection Vehicles

The Eagle name is synonymous with Refuse Collector design. Local Authorities in Britain and throughout the world are familiar with the rear-loading Compressload vehicle designed to provide high compaction for maximum payload carrying, combined with rapid ejection discharge for quick turnround.

The side-loading Retreever is a versatile machine ideally suited for salvage, bulk refuse and domestic refuse collection and displaying the important attributes of low-cost operation, simplicity of maintenance and minimum down-time.

Gully and Cesspit Emptiers

Long experience in vehicle design for sanitation and hygiene requirements has been acquired in the building of Gully and Cesspit emptiers.

Since the first vacuum tanker was supplied to the Baghdad Municipality in 1911, Eagle of Warwick has produced many thousands of vehicles and today the Company's products extend from simple 150 gallon water carriers to the more complex 5000 gallon effluent tankers. This range covers every type of vehicle used by local authorities and other major organisations in this field of operation.

Fire Appliances

Fire fighting presents many special problems and when life and property are at risk the right vehicle, capable of performing its task quickly and efficiently must be available on the spot.

Eagle builds a range of appliances which meet fire authority operational needs and which comply with the British Home Office Specifications. In size these extend from first-strike Landrover based units to large 1800 gallon capacity Water Tenders.

The designs incorporate ample locker space for ancillary equipment and many optional extras from crew cabs to foam monitors can be provided.

In emergency situations dependability and functional design are paramount and this is where Eagle experience comes to the forefront.

Aircraft Ground Support Vehicles

The rapid turnround of modern jet aircraft is essential if costs are to be kept to a minimum and flight schedules maintained.

At airports throughout the World Eagle designed and built vehicles are assisting airlines and airport authorities in this vital task. A whole range of sophisticated equipment has been developed to meet very special needs such as the supply of fresh water, toilet emptying and the de-icing of aircraft.

Speed and reliability are essential ingredients of these operations which Eagle has studied closely and the result is its Skyserve range of vehicles becoming market leaders in this highly technical field.

Road Sweepers

From the sophistication of aircraft support vehicles to road sweepers is a big step but in the latter field Eagle devotes equal time to design and development of new and more efficient products.

The vacuum suction sweeper is an example of Eagles determination to retain the lead in municipal vehicle design. Its tipping body provides rapid load discharge and simplifies vehicle servicing while a variety of attachments and an overhead wanderlead change the vehicle into a versatile machine capable of emptying litter bins and street gullies.

Telecommunications

Eagle experience in specialist vehicle design has been applied, in conjunction with The British Broadcasting Corporation and The Post Office, to produce very special mobile telecommunications vehicles.

One such specialised vehicle carries a 100 ft Transmitting and Receiving Mast which can be operational within 30 minutes of arrival on site producing the vital link in the micro-wave chain throughout the U.K.

For underground installations the Eagle self-contained Cable Drum Carrier is indispensable. It carries 4 tonne drums of cable and is driven into position enabling the cable to be fed through prepared ducts with a minimum of effort and inconvenience.

These highly specialised vehicles are typical of the Eagle philosophy of providing individual customers with a total vehicle design to meet their operational needs, however complex, with efficiency and economy.

Eagle of Warwick is approved to Ministry of Defence standard DefStan 05-21 for the design, development, manufacture and repair of all vehicles described in this brochure.
